AI GOAL SAVER

AI-Assisted Savings Goal Management System

PROJECT REPORT

A web-based financial planning application designed to help users define savings goals, monitor progress, review transaction history, and receive educational guidance from an AI Savings Coach.

1. ABSTRACT

AI Goal Saver is a web-based application for organizing personal savings goals in one central dashboard. The interface brings together a financial overview, total saved amount, active goals, overall progress, a savings portfolio, transaction history, and an AI Savings Coach. Users can create goals, track milestones, and ask practical questions about saving faster, budgeting, or preparing an emergency fund. The design aims to make saving structured and understandable by presenting key metrics clearly and offering contextual guidance. Prepared for author **Swaraj Salunke**, this document outlines the visible interface architecture and intended workflow.

2. INTRODUCTION

Managing money can be difficult when a person has several targets, such as buying a laptop, paying education fees, saving for travel, or building an emergency fund. Without a clear plan, it is easy to lose track of how much has been saved and how far a target is from completion. AI Goal Saver addresses this need through a goal-oriented dashboard that presents savings information and guidance in a single place.

3. PROBLEM STATEMENT

Many users manage savings goals informally using notes, spreadsheets, or memory. This can make progress difficult to measure, especially when multiple goals are active simultaneously. Users may also be unsure how to set a realistic target, prepare an emergency fund, or adjust spending. A simple, organized system is needed to record goals, display progress, and provide accessible educational guidance while keeping the user in full control of financial decisions.

4. OBJECTIVES

- Provide a central dashboard for savings information and goal status.
- Allow users to create and track personal savings goals and milestones.
- Show clear progress indicators that make each goal target easy to understand.
- Present transaction history for credits assigned to goals, where transaction data is available.
- Offer an AI Savings Coach interface for general budgeting and financial queries.
- Promote consistent saving habits through clear, accessible, and user-friendly design.
- Keep financial guidance educational and avoid presenting it as guaranteed professional advice.

5. SCOPE OF THE PROJECT

The project scope, developed for **Swaraj Salunke**, includes the financial overview dashboard, savings-goal management, portfolio summary, transaction-history area, and AI-coach conversation panel. A complete implementation also encompasses secure data storage, authentication, validation, and optional financial account integration.

Intended users: Students, salaried individuals, and other users who want to organize savings targets and monitor their financial progress effectively.

6. PROPOSED SYSTEM AND FEATURES

Financial Overview: Shows total saved amount, active goals, overall progress, and AI health score.

Savings Goals: Entry point to create active goals and track completed milestones.

Savings Portfolio: Summarizes how savings are distributed across target categories.

AI Savings Coach: Offers interactive guidance for budgeting and emergency fund estimation.

7. SYSTEM DESIGN AND WORKFLOW

7.1 High-Level Architecture

Layer	Responsibility
Presentation Layer	Dashboard UI, goal forms, progress cards, transaction list, and coach chat interface.
Application Logic	Validate goal details, calculate saved amounts, classify status, and process coach prompts.
Data Layer	Store user profile, goals, milestones, and transaction records securely.
External Services	AI language model services and optional banking APIs.

7.2 Progress Calculation Formula

Goal Progress Percentage is calculated using the following standard relation:

$$\text{Progress (\%)} = (\text{Current Saved Amount} / \text{Target Amount}) \times 100$$

8. FUNCTIONAL AND NON-FUNCTIONAL REQUIREMENTS

Type	Requirement Description
Functional	Create, view, update, and complete a personal savings goal.
Functional	Calculate overall and goal-specific progress automatically from saved and target amounts.
Functional	Display active and completed goals alongside detailed transaction history.
Functional	Accept coach queries and render AI financial guidance responses.
Security	Protect user account data and prevent credential leakage in application logs.
Usability	Maintain clear labels, intuitive UI hierarchy, and responsive layout across devices.
Reliability	Validate input data gracefully and handle network failures without crashing.

9. USER INTERFACE SCREENSHOTS

The visual structure of the dashboard configured for user **Swaraj Salunke** is illustrated below:

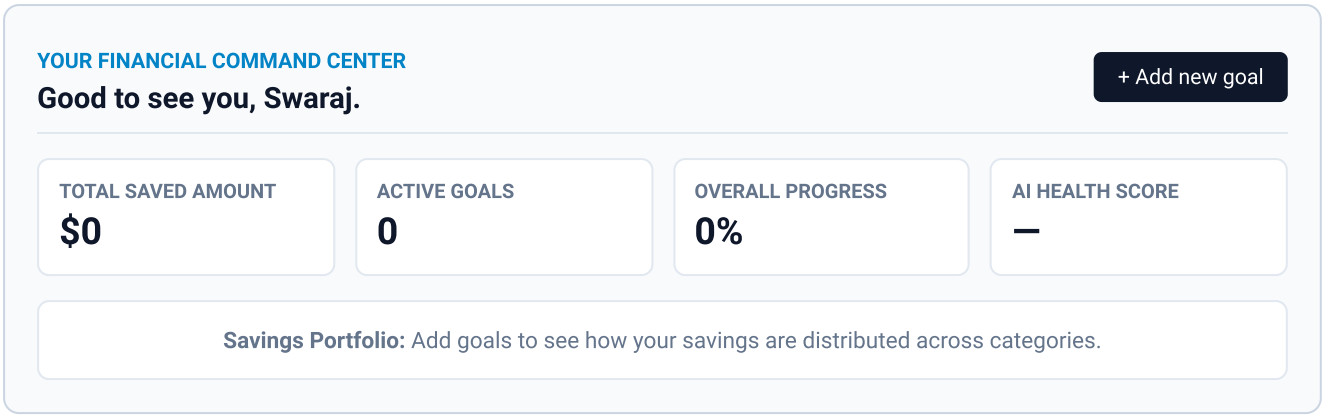

Figure 1. Financial Overview dashboard interface initialized for Swaraj Salunke.

10. TESTING AND VALIDATION

Recommended validation test matrix for verifying application functionality:

ID	Test Case	Expected Result
T01	Open dashboard with no saved goals	Empty states and zero values appear without errors.
T02	Create a goal with valid details	Goal is saved and appears in active list.
T03	Submit a blank goal form	Validation error shown; form submission blocked.
T04	Enter zero/negative target amount	Input rejected with informative alert.
T05	Record a valid contribution	Saved amount and progress percentage update.
T06	Ask coach a financial question	Contextual response generated successfully.

11. LIMITATIONS AND FUTURE ENHANCEMENTS

Current Limitations: Initial deployment displays empty default state until goals are created. Automated bank feed synchronization requires explicit user permission and backend setup.

Future Enhancements:

- Integration with automated recurring savings deposits.
- Advanced predictive modeling for timeline estimation based on spending habits.
- Multi-currency support and localized inflation adjustment.
- Export functionality for tax and personal audit reports.

12. CONCLUSION

AI Goal Saver provides an intuitive, structured environment for users to plan and accomplish financial milestones. By unifying goal tracking, analytics, and interactive AI advice, the application simplifies personal asset management. Prepared under the authorship of **Swaraj Salunke** (Swaraj Pravin Salunke), this project report establishes the complete functional and structural baseline for implementation.

13. REFERENCES & CHECKLIST

- Official web development framework documentation (React / Web APIs).
- Financial literacy guidelines and budgeting formula standards.
- UI/UX design standards for modern dashboard layouts.
